**DESCRIPTION:** The letterbox is constructed of High Grade Expanded Polystyrene pre-treated with a polymer, reinforced and then recoated and allowed to cure. A base coating is then applied, providing a surface ready for your selected final coating after installation.

**INSTALLATION:** The letterbox can be installed into a concrete pad 100mm deep, and wide enough to provide a 100mm wide mowing strip surrounding the letterbox. Fill the pad with 50mm of concrete, position your letterbox and apply the remainder of the concrete to encase the letterbox within the pad area. Alternatively your letterbox is designed for it to be erected onto a 100mm<sup>2</sup> treated timber post. If this method is preferred apply a generous bead of Bostik Tuf-As-Nails Original Formulation to all faces of the dry post, then slip the letterbox down over the post to the desired height and allow the adhesive to cure. (support may be required as the adhesive cures)

**IMPORTANT NOTE:** The base of the letterbox must not be exposed to open ground and must be encapsulated in concrete.

**FINISHING:** Once installed a good quality acrylic paint to the colour of your choice may be applied or alternatively a complementary Texture Coating system may be applied.
